Topic 15 | Evidence Report

N8N Hands-On Beginner Course - Split in Batches & Basic Error Handling

Evidence based on the two submitted n8n screenshots. The assessment tests batching, feedback looping, error tolerance, and successful completion.

1. Workflow execution overview

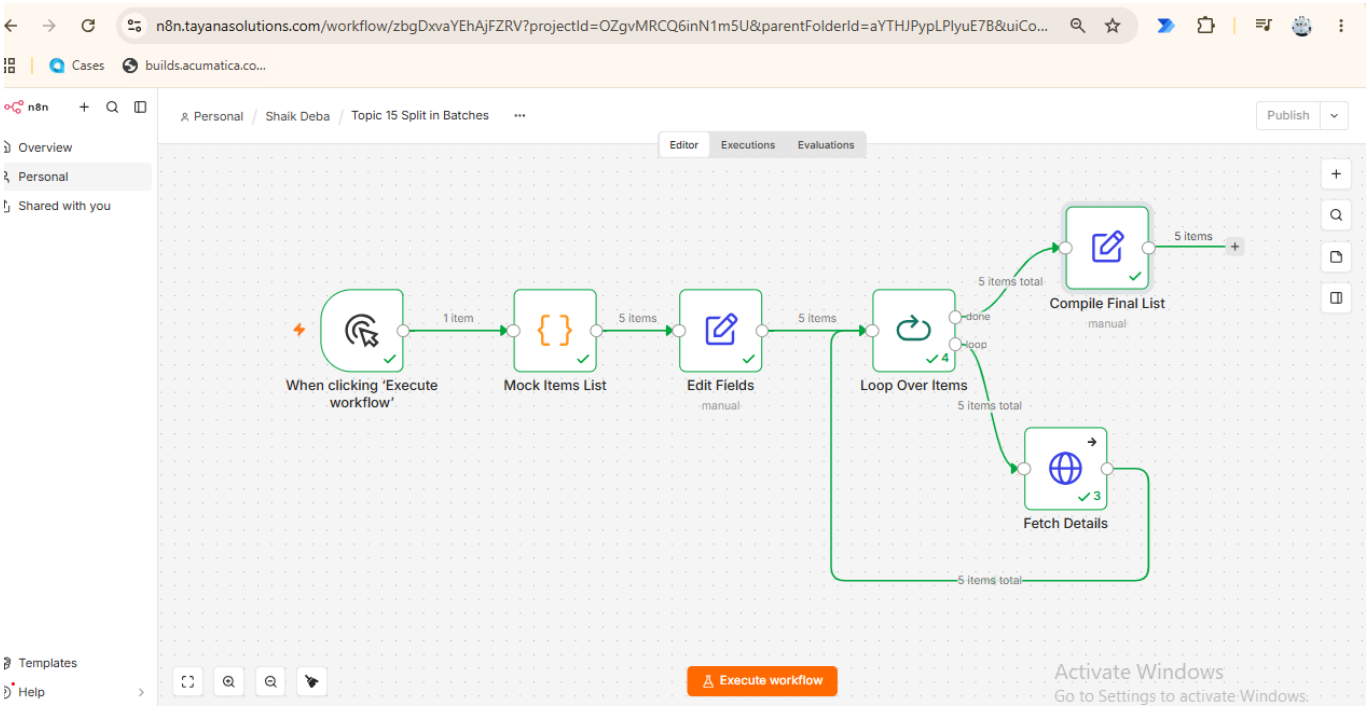

Figure 1. Workflow canvas: five mock items enter the loop, Fetch Details executes three times, and the Done branch passes five items to Compile Final List.

Observed execution

The canvas displays 5 items entering Loop Over Items, 3 executions on Fetch Details, and 5 items on the Done branch. All shown nodes have green completion indicators.

2. Completion output and error evidence

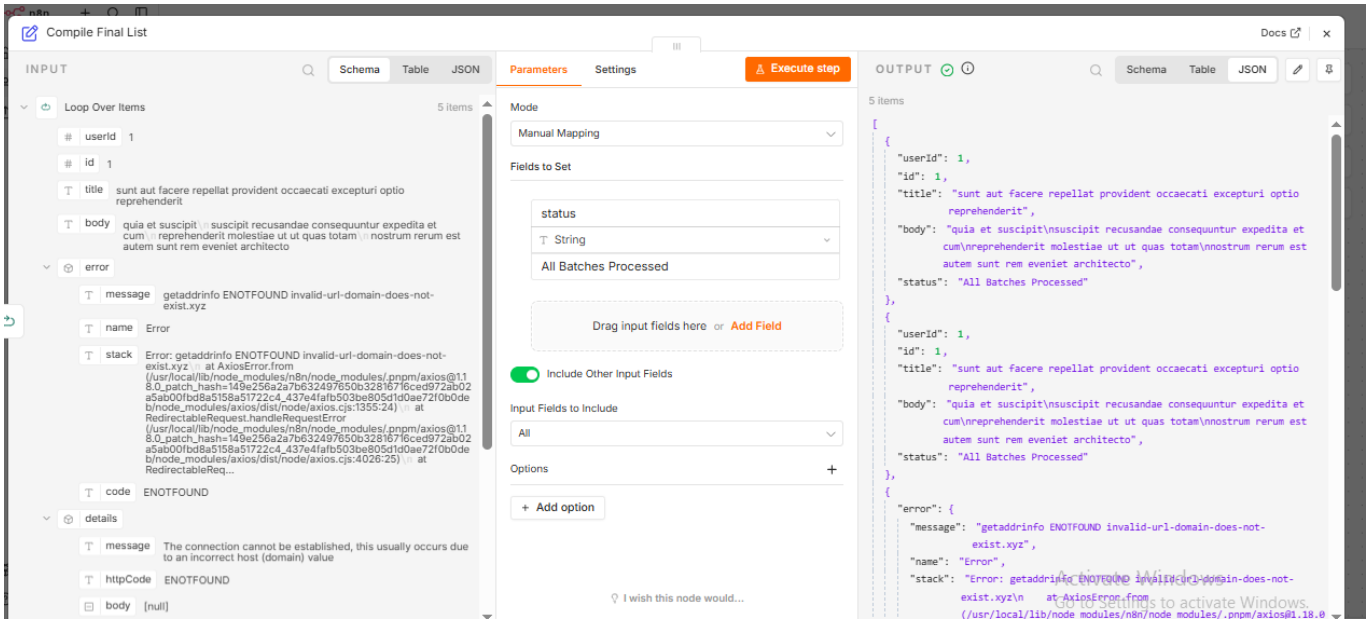

Figure 2. Compile Final List: five items are returned with status All Batches Processed; the captured invalid-domain failure appears as ENOTFOUND in the error payload.

Observed validation

The final node receives 5 items and sets status to All Batches Processed. The input panel contains an error object with code ENOTFOUND for the intentionally invalid domain. The workflow therefore continued to completion despite the failed HTTP request.

3. Additional Execution Evidence

The following screenshots show the final output with five status records and the third HTTP Request iteration continuing successfully.

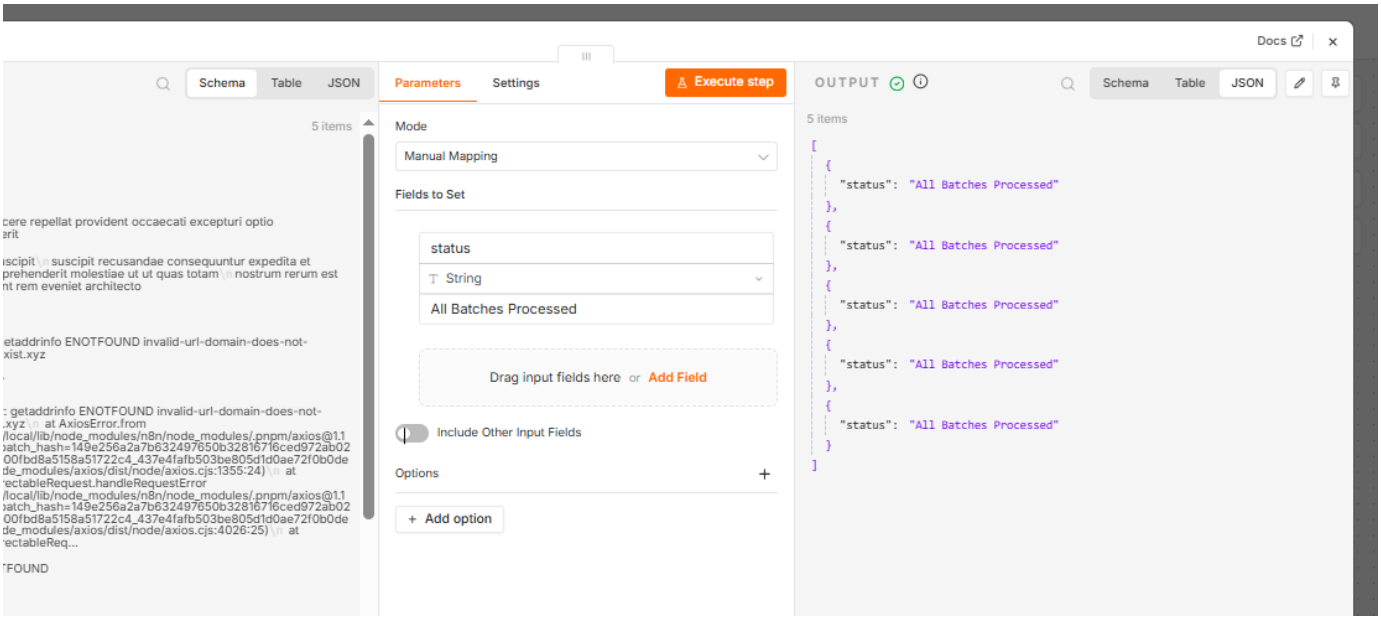

Figure 3. Compile Final List returns five records, each with status All Batches Processed. The Include Other Input Fields toggle is off.

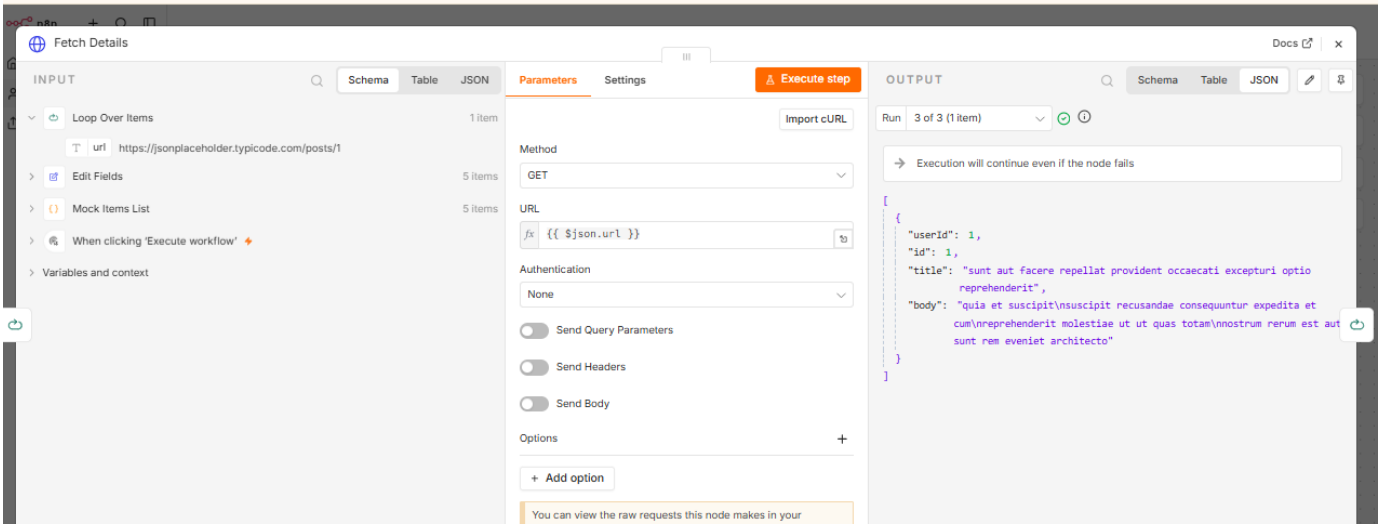

Figure 4. Fetch Details run 3 of 3 displays a successful JSON response and the message Execution will continue even if the node fails.
